Keywords: smallholder farmers, appreciative inquiry, rapid supply chain appraisal, community

Introduction

The Papua New Guinea economy is in transition to a semi-commercial/commercial farming system. However, the majority of the population of PNG practice subsistence farming (Mopafi 2004). To accommodate change, understanding the capacity of farming communities to adapt and be socially resilient is essential (Adger 2000). We are implementing a project to increase vegetable production in Central Province (CP) for Port Moresby (PoM) markets (ACIAR 2010, Birch et al 2009) in partnership with Fresh Produce Development Agency (FPDA), National Agriculture Research Institute (NARI), Pacific Adventist University (PAU), Central Province Administration (CPA) and Greenfresh (GF), of PNG. Here, we discuss strengths and weakness of smallholder farming in several locations in CP in terms of adaptation to change and social resilience.

Methods

To gauge capacity for change and social resilience, we used the Appreciative Inquiry (AI) framework (Cooperrider et al 2003) and Rapid Supply Chain Appraisal (RSCA, Collins and Dunne, 2008). These elicit current vegetable farming realities and ideas for change within communities or contexts. Use of AI engages the community, builds trust among members and encourages sharing of knowledge (Raymond 2006). The method is cyclic and has four layers - the 4-Ds: Discovery, Dream, Design and Destiny. During initial interviews, we used the first two – Discovery and Dream – and asked participants to name the best and most problematic things about vegetable growing and to envision the future (Table 1). In a follow-up workshop with participants (often run on gendered lines), Dreams provide the entry point for exploring Design, which encourages thinking about strategies to improve vegetable growing, and Destiny, which encourages them to implement actions and provide feedback to the community (Watkins and Mohr 2001). This paper reports on the Discovery and Dream components undertaken with smallholder farmers in several locations in CP, chosen because of the (i) need to enhance socio-economic conditions (Birch et al, 2009) (ii) potential to improve vegetable production identified in consultation with the stakeholders and small farmers; and (iii) climatic conditions favourable to increase vegetable production for PoM. Thus, Bautama (Hiri district), Rigo–Koiari (Rigo district), (lowland areas SE of PoM) and Tapini (Goilala district, Highlands NW of PoM) were chosen. A collaborative approach to cross-cultural research is an important value underpinning AI/RSCA methodology, and was evaluated by our PNG partners for cultural appropriateness. We then decided to use focus groups instead of individual interviews, and constructed focus group questions (Table 1)
with our PNG partners facilitating development of their research skills (Reason and Bradbury 2008).

Smallholder participants (men, women and young people) were contacted by FPDA to confirm their availability. Focus groups of men and women were conducted separately at each locality, in groups of 4 to 15, allowing both men and women to present their views. Questions were asked by Australian and PNG researchers in English and a local language e.g. *Tok Pisin, Motu*. Responses were recorded by the interviewer in English and accuracy was
confirmed. A reflection process was included to ensure arrangements for and execution of interviews remained appropriate (Reason and Bradbury 2008), and to explore reasons for any differences among data from each interviewer.

Results and Discussion

As AI focuses on community strengths (Watkins and Mohr 2001; David and Michel 2004), it provides information on building the capacity of smallholder farmers and mitigating their vulnerability during social and economic change. However, negative institutional arrangements and structural issues may emerge and have to be explored by for example RSCA. Both strengths and weaknesses will influence processes of capacity building and adaptation to change. Key words repeated around growing and marketing of vegetables (themes) were identified but not ranked at this stage. Positive themes were around food security, family labour and farming commitment, whereas negative themes were clustered around inputs, transport, markets, services and socio-cultural constraints.

Strengths that favour the community capacity to adapt to change and resilience
(i) Food Security of farmers who grow food for the family and relatives, with surplus produce sold to meet family expenses e.g. school fees, and to improve diet through purchase of rice, meat, tea and sugar (also reported earlier for PNG in Mueller et al. 2001).
(ii) Family members (including children) labour contribute to farming, with women playing a vital role in selling produce in the market for cash to spend on family needs. This confirms reliance on family labour over costly hired labour. However, the disadvantage is the potential for delays in work due to absenteeism for social commitments or illness (Allen 1996).
(iii) Desire of participants including majority of youth to remain in farming – confirms that small scale farming with cash crops can be an attractive alternative to migrating to the cities, with youths wishing to expand their farms rather than migrating. However, concern that urban migration was reducing the farming workforce had been found in an earlier study (Birch et al 2009), and could be regarded as a weakness or even threat.

Weakness that constrain community capacity to adapt to change and resilience
(i) Limited availability and cost of inputs and knowledge gaps constraining production – in particular that most available vegetable seeds were not developed for local environments so crops did not perform well, lack of irrigation infrastructure necessitating laborious hand watering, lack of tools for soil preparation and limited knowledge of pest and disease control.
(ii) Poor access to markets, transport and support services and distance from research and extension services are major constraints that weaken linkages and limit resilience (Mopafi 2004).
(iii) Socio cultural constraints such as lack of individual land ownership, the absence of trust, inequality for women in production and marketing, intensive management of labour and the high priority of cultural obligations (Mopafi 2004) may also constrain cropping decisions and compromise production and community unity, and thereby resilience.
(iv) Post harvest constraints include difficulties with cash and selling small amounts of produce, lack of storage facilities and lack of knowledge about post-harvest preservation and packaging.

The strengths of subsistence farming predominantly relate to on-farm activity, perhaps founded in long established socio-cultural norms, while the weaknesses relate largely to inadequacy and unreliability of off-farm services with the exception of inadequacy of knowledge of technical and marketing aspects. The last mentioned point needs to be
addressed through extension and education, while the off-farm weaknesses can only be addressed through major redesign of the systems involved. On-farm strengths will be enhanced by overcoming on- and off-farm weaknesses to improve the comparative economic strength of rural and urban communities.
